

# Silent Feast

## Overview

Silent Feast is a strategy and bluffing tabletop card game where players take on the role of vampires competing to consume the blood of villagers while managing risks and accumulating power. The game revolves around a unique mechanic of blood accumulation, strategic card usage, and resource management, requiring players to make critical decisions to outsmart their opponents and avoid explosive consequences.

The silent village reeks of iron and despair. Once a secret laboratory for humans, scientists, and vampire hunters, it now lies in ruins, left with only abandoned "experiments"—the villagers. A horde of starved vampires has followed the scent of blood here. They must feed on the villagers to survive, but every choice teeters on risk: feast alone, or push the lethal "poisoned blood" onto a fellow vampire? The game of survival begins the moment they step into the village.

## Booklet / Core Gameplay Loop

### I. Core Objectives

**2-Player Game:** Win by being the first to accumulate 50 Blood Points (BP) or forcing the opponent to reach 15 Toxin Points (TOX).

**3-6 Player Game:** Win by being the first to accumulate 60 BP. If a player's TOX reaches 20, they are eliminated, and the remaining players continue.

**Creative Mode:** Players may adjust the winning BP/TOX values and the ratio of the four Operation Cards ("None, Garlic, Convert, Antidote") to alter difficulty.

Players can choose from 6 original characters with different unique skills. (trivial&fun)

## II. Cards & Setup

### 1. Card Types

**Operation Cards:**  
4 types—None (no effect), Garlic (triggers poisoned blood), Convert (triggers vampire blood), Antidote (neutralizes toxins).

**Item Cards:**  
4 types—Peek, Detox, Slay, Blood loot.

## 2. Initial Setup

### Villager Cards:

Equal to  $2n$  for  $n$  players (stacked face-down as the "blood source").

Item Cards: Each player starts with 2 random Item Cards.

Setup the card pile.

**NGCA Card System:** The game features four types of blood drinking operation cards: Normal (N), Convert(C), Action (A), and Garlic (G). **Each card type has a unique effect:**

**Normal (N):** Basic blood-drinking cards used for regular blood collection.

**Convert (C):** convert the victim's blood to vampire blood which is poisonous for vampire.

**Antidote (A):** countereffect of convert card.

**Garlic (G):** A defensive card that poison vampires from drinking blood from a certain villager, rendering them toxic and useless for consumption.

### III. Turn Sequence

Each player's turn proceeds as follows, with "blood drinking" actions (interspersed) flexibly:

**Use Item Card:** Only 1 Item Card can be used per turn (discarded after use).

**Blood Drinking Phase (core action):**

Choose 1 villager (draw from the top of the Villager Card stack) and start "drinking": draw 2 cards and reveal them as the "first sip."

**Blood Type Judgment:**

**H (Human Blood):** Continue drinking (no upper limit; proceed to the next sip until V/G is triggered).

**V (Vampire Blood):** Stop drinking and take corresponding toxins (based on sip count; see "Chain Drinking Rules").

**G (Garlic Blood):** Stop drinking, take corresponding toxins, and the villager is eliminated (moves to "awaiting Slay").

**Chain Drinking Rules (unlimited sips):**

**1st sip:** +1 BP; if V/G is triggered, +1 TOX.

**2nd sip:** +2 BP; if V/G is triggered, +2 TOX.

...

**nth sip:** +n BP; if V/G is triggered, +n TOX (n = positive integer; stops only when V/G is triggered).

**Designated Drinking:** You may assign the "current sip" to another player. The designated player can draw 1-3 Operation Cards to judge:

**If C-A (Convert - Antidote) count  $\geq 2$ :** Judged as V (vampire blood).

**If G (Garlic) is present:** Judged as G (garlic blood).

**Skip Turn:** Choose to forgo drinking and gain 2 Operation Cards or 2 Item Cards (choose one).

#### Detox

Reduce your TOX by 1 during your turn.

Usable when designated to drink in another player's turn (to neutralize partial toxins).

#### Slay

Target a villager eliminated by G blood: Gain all hand cards (Operation/Item Cards) from that villager's stack.

**Target a villager judged as V blood:** Gain 2 BP but take 1 TOX.

#### Spy

View 1 card of a chosen villager before deciding to drink (only visible to you).

Usable when designated to drink in another player's turn (to preview risks).

#### Blood Loot

Use on another player to reduce their BP by 4 and increase your TOX by 1 (usable once per turn, during your turn).

V. Special Rules

**Villager Resupply:** When all villagers are judged as V or G blood, immediately add 1 new villager (drawn from the reserve stack).

**V Blood Villagers:** Plaayers may agree on whether V blood villagers (revealed) can be pushed to others (allowed by default).

**G Blood Restriction:** Villagers judged as G blood are eliminated and cannot be drunk by any player.

Stacking Mechanism ("Blow-Up Mechanism")

The core mechanic of the game involves stacking blood cards. Each time a player drinks blood, the cards are added to the stack, and when the stack reaches a certain threshold, a "blow-up" effect occurs. Players must carefully manage their stacks, knowing when to trigger a powerful chain reaction or when to hold back.

Higher the risk, higher the profit.

Chain Leech/Strategy

Happens on the same turn, you can get infinite bonus turn when It's H blood.

Designated

when designated to drink blood you share the same risk/profit.

This usually happens when the current villager stack is C-A=1/0. You can choose to draw 1-3 cards. draw 3 cards is very risky and bold, draw 1 card is relavently safe

Your Own Will

It is safe when the villager's stack has more Antidote than Convert. But careful for the probability of Garlic card. It can make you suffer from the accumulated risks of increasing Tox points and cause sudden death.

Chain Leech Benefit/Risk

your first sip will get you BP/TOX +1;  
second will get BP/TOX +2;  
and so on.....

The question is , when it reach the limit of C-A =1 , you will risk your chance to drink, or rather give the chance to your opponents?  
Don't get too greedy.

It happens when people risk their 6th or 7th sip and get poisoned, BP+6/7.

Leech and Tox Mechanism

Each time a player drinks V blood or G blood, their Tox level increases. Tox represents the toxicity in the vampire's body. If Tox reaches a certain point (exp.15), the player loses. Players can accumulate Blood Points (BP) by successfully drinking H blood (normal blood), but they must manage their Tox level carefully to avoid triggering an explosive failure.

Chain Drinking

If a player drinks from the same villager multiple times in a row, the chain drinking mechanic comes into play. This increases the effects of the blood drink and allows for a cumulative bonus, but it also raises the Tox level with each subsequent drink. This is fun-----combined with Leech and Tox Mechanism, risk and profit grows through the Chain Drinking Steps, they may be reluctant to withdraw or designate their fellow player to drink, for the next sip may cause great Blood Point Profit.

Those delicate gameplay and mechanics make the body and soul of this game.

VI. Victory Summary

**2-Player:** First to 50 BP or opponent reaches 15 TOX.

**3-6 Player:** First to 60 BP or all others eliminated by 20 TOX.

**Creative Mode:** Customize BP/TOX and card ratios for varied difficulty.

## Visual Style & Card Design

### Detective

Spy 2 cards when using the *Spy* card

### Nurse

Gain 1 extra BP using *Bloodlood* and don't gain its countereffect-tox

### General

Gain Extra 2 Blood Points when using the *Slay* Card

### Reaper

Gain Extra 1 item card anytime when a villager is eliminated (*Slayed* or *Garlic*)

The game adopts an oil-painting style with a semi-realistic anime influence. Characters and card designs are rich with dark, moody tones that reflect the game's gothic and eerie atmosphere. The thick brushstrokes create depth, adding texture to the game's visuals while maintaining a traditional oil-paint aesthetic.

### Target Audience

**Strategy Enthusiasts:** Players who enjoy strategic thinking and long-term planning will find Silent Feast engaging due to its complex decision-making and risk management elements.

**Fans of Gothic and Vampire Themes:** Players who enjoy dark, gothic atmospheres, and vampire lore will be drawn to the game's aesthetic and thematic elements.

**Tabletop players / Party fun game players:** This is also a social game that people can interact with their friends. Although the booklet ensures a 2-6 player game, the game is always highly customizable. Theoretically the amount of players are unlimited. People can craft their own expansion cards/vampires with their pen and paper.

# Playtest & Iteration

The development of Silent Feast went through multiple iterations shaped by continuous playtesting and feedback from my peers.

### First Version — Operation Card Placement

In the earliest prototype, drinking blood was executed by placing “operation cards” (N, C, A, G) directly onto villagers. While functional, this design quickly revealed several issues during playtests with classmates (using the HTML demo version).

This feedback highlighted that the game was leaning too heavily on visible set-play rather than suspense, making the experience less engaging and dynamic.

### Second Version — Risky Chain-Drinking Mechanic

In response, I redesigned the core mechanic into what is now the chain-drinking system. **Instead of pre-placing cards, players now draw directly from the blood deck during their turn.**

Drawing 2 cards determines the villager’s blood type.

A successful drink (H) allows the player to risk continuing, escalating both reward (BP gain) and danger (Tox risk).

One misstep with Garlic (G) or turning into a Vampire (V) ends the chain dramatically.

This shift immediately transformed the gameplay. Players described the new mechanic as:

“This feels like gambling. Every extra sip makes my heart race.”

“Finally, there’s real tension between greed and caution.”

“It’s simple to explain, but every turn feels dangerous and fun.”

“I feel like the strategy is too predictable once I see how many cards are stacked.”

“It’s more about memorizing card positions than about taking risks.”

“Turns feel slow. I’m waiting for the other player to stack, but there’s not much tension.”

### Outcome

Through this iteration, Silent Feast evolved from a slow, deterministic card-placement game into a fast-paced, suspense-driven experience. The new system emphasizes risk-reward tension and creates the thrilling, almost addictive feeling I was aiming for.

Download

• Chain Sucking: Only on your turn, when you designate yourself to drink, if H is resolved, you can chain suck: 1st level=1, 2nd level=2... You can click "End Turn" to stop anytime. If any drink resolves V/G, end turn immediately and calculate Tox by current level.

• Designate Opponent to Drink: Your turn ends immediately; the designated can choose to draw 1 / 2 / 3 cards for this drink, but no chain sucking. This drink's level = your current chain + 1.

• Peek (tool): Only you can see the top of the deck ("the card before drawing this drink").

• Slay (tool): Active slot → you +2BP and refresh; Retired slot → plunder all operation cards from its stack to your hand and refresh.

• Leech (tool - once per game): Opponent -4BP; you +1Tox.

• Sacrifice Turn for Supply: Before any drinking in this turn, you can forfeit the entire turn to get 2 operation cards or 2 tools from the market (unlimited by turns).

• Deck: A truly shuffled physical operation card deck (can adjust counts of N/C/A/G in settings; G is fewer by default).

I got too greedy and gained 6 tox in 6th chain drinking for a Garlic Card.

11

## Into card game problem - when it is short of cards

In physical tabletop games, the constraint of limited card quantities creates unique challenges—unlike digital versions that can infinitely generate or shuffle cards, physical decks shrink as play progresses, distorting probabilities and risking stale gameplay. This scarcity demands deliberate rules to keep the game balanced and dynamic.

To address this, let's start with a refined card composition tailored to finite quantities: 40 N, 15 G, 40 C, and 25 A (totaling 120 cards). This ratio—roughly 8:3:8:5—works with limited stock by ensuring key dynamics stay consistent even as cards cycle through play. Garlic (G) cards, at 15, are abundant enough to remain a credible threat; too few, and early A-heavy draws would let players chain-suck without fear, exploiting the finite deck's shrinking risks. A cards (25) are capped to prevent over-safety, while N (40) and C (40) form a stable core to anchor the game's rhythm.

Additionally, a "major reset" triggers when no H-type villagers (those resolving to H results) remain on the field. With limited cards, such stagnation—where all slots lean toward V/G outcomes—would stall play. The reset refreshes all villager slots, shuffles all discarded cards into a new draw pile, and restarts the deck cycle, turning scarcity into a catalyst for renewed engagement.

Shuffling rules must account for limited cards to avoid depletion. When a player uses "Slay" on a villager slot containing G cards (a "G-blood villager"), two things happen: first, all discarded cards (from retired slots, used operations, and the remaining draw pile) are shuffled back into play—recycling the finite deck to refresh probabilities. Second, the player gains an extra tool card as reward, incentivizing strategic use of Slay on high-risk G targets despite the shuffle.

These rules turn the limitation of finite physical cards into a strength: by cycling and resetting thoughtfully, the game maintains tension, ensures G cards retain their deterrent value, and keeps every draw meaningful—even as the deck shrinks and shifts.
